

Decentralized
Charity System

Transparent Social Impact

Hope Center is a platform that brings transparency to social funding through blockchain technology.

This project solves problems like:

1. Wasted Money
2. Lack of trust
3. Lost Potential

Working

Whenever a user donates money to the organization a block is created in the deployed blockchain and the user gets notified that he has donated money. Same is the case for the organization. For the organization a weekly target is set and at the end of the week the donated amount is used. The transaction by the organization is again created on the blockchain and the user gets a notification if the work is done or in case the amount is less it will be used for next week's target.

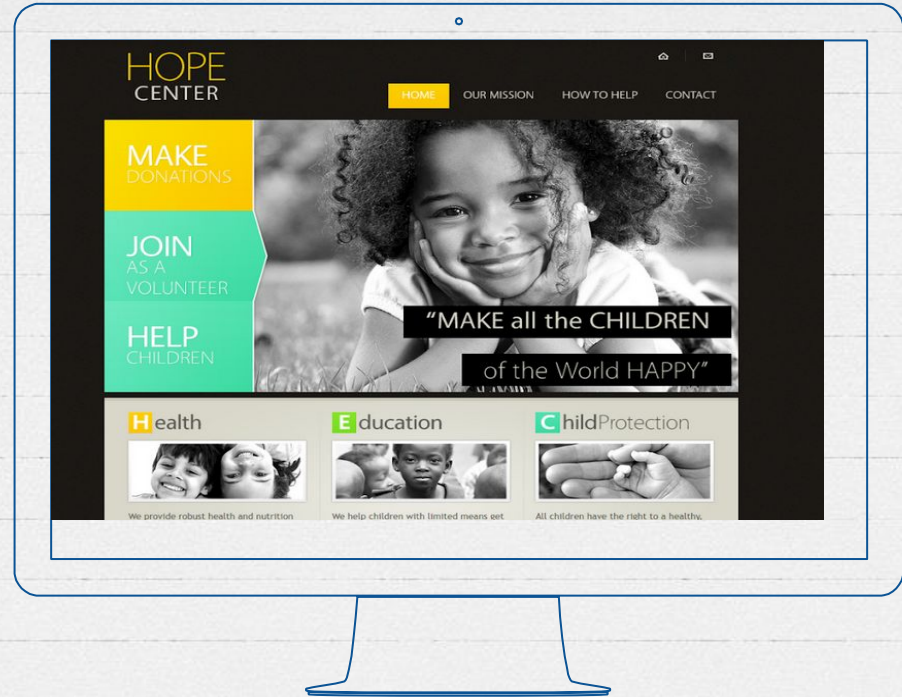

Advantages of this System

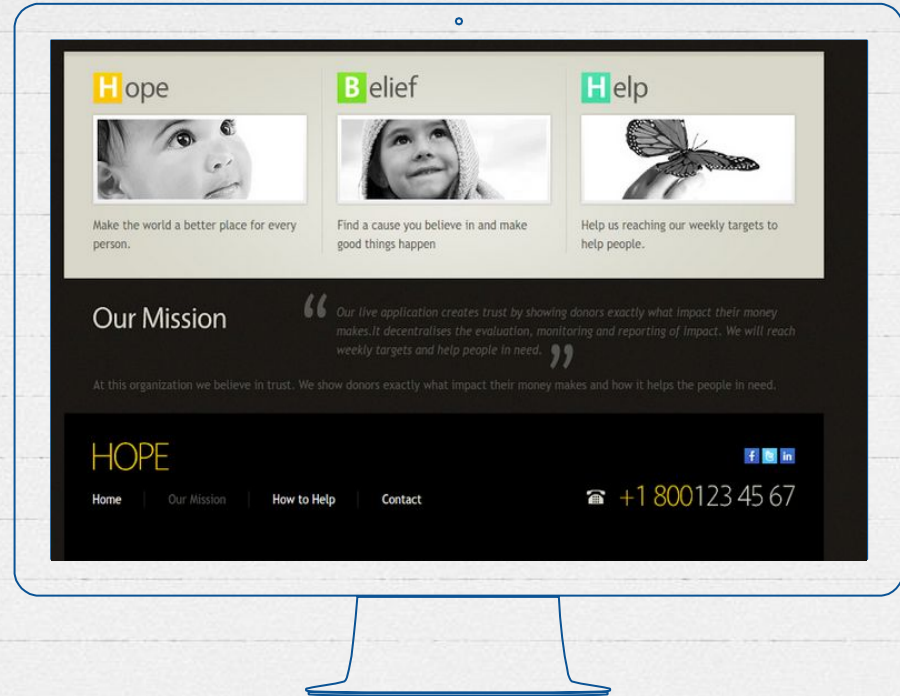

The performance of each weekly target is available at the end of the week, making it easier for funders to identify and help scale social projects that actually work.
